Inside address
Lines separated as shown

Friends,

This is an example letter typeset with the `uconnletter` class file for use with $\text{\LaTeX}2\text{e}$. You may customize it for your own purposes by altering the arguments appearing in the preamble of this sample file. The class understands all the options of the usual letter class. Note that the class will ignore any usage of the `\address{}` command, as all that data already appears in the header.

The class will automatically set your `\signature` using the `name` entry in the preamble, though you can reset it by explicitly using the `\signature` command as usual.

If you find any issues or bugs, please let me know about them.

Sincerely,

Alexander Russell
